TITLE: Some aspects of the immunopathology of animals chronically exposed to radioactive zinc ( $Zn^{65}$ )

SOURCE: AMN SSSR. Vestnik, no. 9, 1965, 65-70

TOPIC TAGS: zinc, immunology, radiation damage, radioisotope, antigen, pathogenesis, gamma globulin

ABSTRACT: Daily peroral administration of  $Zn^{65}C_2$  (10  $\mu$ c per kg of weight) to rabbits for 18 months significantly altered the animals' antigen structure and protein fractions and brought about morphological changes in various tissues. Antibodies against homologous denatured protein clearly appeared during the 9th month. At the same time there was a marked decrease in the serum albumins while the quantity of

gamma and beta globulins increased and the albumin-globulin ratio underwent phasic changes--all suggestive of dysglobulinemia. Tissue changes in the hematopoietic organs included hyperplasia of the reticuloendothelial elements, increase in the number of foci of extramedullary hematopoiesis in the spleen, lymph nodes, and lungs, and enlargement of staff and band cells in bone marrow. Degenerative changes were noted in the liver, kidneys, thyroid, and gonads. Signs of radiation lesions appeared between the 16th and 18th months. Rabbits given smaller doses of Zn<sup>65</sup> exhibited the same immunological and morphological changes as those receiving the 10  $\mu$ c/kg dose but they were less pronounced. Autoimmunological mechanisms play a major role in the pathogenesis of chronic radiation damage. Orig. art. has: 1 figure.

TITLE:

A Hydraulic Motor, Model PM-400, for Driving of Honing  
Machines (Gidrodvigatel' mod. PM-400 dlya privoda  
khoninoval'nykh stankov)

PERIODICAL: Stanki I Instrument, 1958, Nr 8, pp 41-42 (USSR)

ABSTRACT: A 15-cylinder swashplate type hydraulic motor with two opposed plungers in each cylinder is described and shown in cross section. The unit has been manufactured by the "Gidroprivod" Works in Khar'kov to the design of SKB-7. The motor consumes up to 60 kW, weighs 210 kg, has a maximum speed of 950 rpm, a maximum oil consumption of 400 l/min and a maximum pressure of 100 kg/cm<sup>2</sup>. Speed control is accomplished by variable oil flow to the motor, and permits reversal of rotation in operation. There is 1 illustration.

SA FILATOV, S.

Preparation of methylethyylaniline. Ya. Ya. Makarov, Zemlyanskiy, S. I. Filatov and V. S. Vilechkin. J. Applied Chem. (U.S.S.R.) 10, 100 (1937). - (a)  $\text{Me}_2\text{SO}$ , (318 g.) was added while drops to the soln. of  $\text{PhNH}_2$  204,  $\text{NaOH}$  252 g., and water 370 cc., while keeping the temp. always below  $4^\circ$ , with const. stirring. The stirring was continued for 1 hr. after all the  $\text{Me}_2\text{SO}$  had been added, and the resulting soln. was treated with 200 cc. of 40%  $\text{NaOH}$ .  $\text{PhNH}_2\text{Me}$  (I) was extd. with 100 cc. (4 times) and dried over  $\text{NaOH}$  (solid). After 12 hrs., the  $\text{Et}_2\text{O}$  was distd. off and I was fractionated. The yield of I by 200-4°, was 100 g. (70%). (b)  $\text{MeC}_2\text{H}_5\text{SO}_2\text{Me}$  (II) was added in small portions with const. stirring to the mixt. of  $\text{PhNH}_2$  10.1 g. in a soln. of  $\text{NaOH}$  8 g. in 12 cc. of water preheated to  $80^\circ$ . After the addn. of II, the mixt. was kept at  $80^\circ$  for 1 hr., then the resulting mixt. was treated with 20 cc. of 20%  $\text{NaOH}$ , and cooled. I was extd. with  $\text{Et}_2\text{O}$ . The yield of I, b. 200-4°, was 85.69% (theory). (c) The mixt. of  $\text{PhNH}_2$  103,  $\text{MeOH}$  54.8, conc.  $\text{H}_2\text{SO}_4$ , 7.30 g. was heated in a rotating steel autoclave for 10%, hrs. at  $170^\circ$   $185^\circ$  and finally at  $210^\circ$  for 2 hrs. Then, the excess of MeOH was distd. off and the mixt. of secondary and tertiary amines was steam-distd. extd. with  $\text{Et}_2\text{O}$  and dried over solid  $\text{NaOH}$ , yielding I 80.83 and  $\text{PhNH}_2$  0.07%. II, 80, can be substituted by  $\text{MeHSO}_2$  (10 g.) and the mixt. heated gradually (10 hrs.) from  $185^\circ$  to  $204^\circ$ . In this case the yields were 88.78 and 0.79%, resp. (d)  $\text{PhNH}_2$  107,  $\text{MeOH}$  54.8 and  $\text{Me}_2\text{SO}$ , 11.3 g. were treated as in (c), heated for 0.5 hrs. at  $180^\circ$ ,

for 3 hrs. at  $180^\circ$ , and for 3 hrs. at  $210^\circ$ , yielding 184.0 and  $\text{PhNH}_2$  0.46%. For identification of the I obtained, its picrate was prep'd.; it forms light yellow rhombic crystals, m. 141-3° (after several recrystns.). Komarov (U. S. S. R. 1920) and Singh (C. A. 11, 1110) gave the m. p. of this picrate as 121-2° and 134-5°, resp., but the ultimate analysis of the picrate obtained proved that the picrate of I m. 141-3°. The content of I in the mixt. of amines was detd. by transforming it into  $p\text{-NO}_2\text{C}_6\text{H}_4\text{NHC}_2\text{H}_5\text{Me}$ , m. 67°, by the usual method (keeping the temp. below  $1^\circ$ ), with a yield of 94% (theory). Twenty-eight references.

TITLE: Dark crust in the macrostructure of stainless heat resistant alloyed structural steels

SOURCE: Stal', no. 6, 1964, 540-544

TOPIC TAGS: steel, stainless steel, heat resistant steel, crust formation, steel 13Kh12NMFA, steel 13Kh14NVFRA, steel 20Kh15N3MA, steel Kh17N2, steel 4Kh9S2, steel Kh28, steel Kh17, steel Kh25, structural steel 18KhNVA, structural steel 15KhGNTA, structural steel 18KhNT, structural steel 4OKhNMA

ABSTRACT: This study is a continuation of a previous investigation on the nature of dark crusts common on stainless heat-resistant steels of the types 13Kh12NMFA, 13Kh14NVFRA, 20Kh15N3MA, Kh17N2, Kh17, Kh25, 4Kh9S2, Kh28 and on the alloyed structural steels 18KhNVA, 15KhGNTA, 18KhNT, 4OKhNMA. The investigation consisted of metallographic analysis of samples cut from "healthy" and from defective sections of ingots, and the comparison of their compositions and structures. Metal-

Card 1/2

ACCESSION NR: AP4040388

graphitic study showed that defective sections were richer in carbon, aluminum, and aluminum oxides. Large silicate inclusions of complex composition with multiple aluminate inclusions were found to be distributed regularly in the direction of deformation. Corundum represented the basic part of the precipitate and occurred in the form of transparent colorless grains ( $N_g = 1.767$ ). Spinel and titanium were less common. The precipitate also contained colored anisotropic inclusions with  $N_g = 1.775$ . The experiments revealed that the dark crust originated in the deadhead zone and penetrated the body of casts during the crystallization period. Defects caused by crust formation were eliminated by preventing the chipping of the crust and its subsequent sinking into the metal. This was achieved by decreasing the heat of flux by sprinkling lunkerite 28, vermiculite powder, or chamotte over the ingots (2 kg per ton of metal). Orig. art. has: 1 table, 6 figures, and 1 formulas.

TITLE: Effect of cerium on the structure and properties of OKh23N18 steel

SOURCE: Stal', no. 11, 1966, p41-44

TOPIC TAGS: <sup>CERIUM</sup> oxidation resistant steel, stainless steel, chromium nickel steel, cerium containing steel, steel structure, steel property/OKh23N18 stainless steel

ABSTRACT: Several heats of OKh23N18 stainless steel were melted in a 10-ton basic arc furnace, with ferrocerium added as the finishing period and cast into 2.7-ton ingots. It was found that the presence of cerium in the solid solution affects the diffusional processes taking place in steel during its crystallization and thus helps to reduce dendritic nonuniformity. This in turn results in a more uniform structure which makes it possible to expand the hot-working temperature range without danger of cracking. Orig. art. has: 6 figures.

Preduprezhdeniye i analiz braka v mashinostroyenii (Prevention and Analysis of Waste in Machine Building) Moscow, Mashgiz, 1957.  
221 p. 6,000 copies printed.

Reviewers: Bozhukov, B.P. and Filatov, S.R., Engineers; Ed.: Rabinovich, P.M., Docent; Ed. of Publishing House: Temkin, A.V.; Tech. Ed.: Uvarova, A.F.; Managing Ed. of literature on the economics and organization of production: Saksganskiy, T.D.

PURPOSE: This book is intended for industrial engineers, technical personnel and economists.

COVERAGE: The book deals with the analysis of production rejects and methods of current production control. Special emphasis is placed on statistical methods of production quality control and the analysis of manufacturing processes used in Soviet and foreign plants. Various methods of production inspection and non-destructive testing, such as ultrasonic and radiographic methods,

Prevention and Analysis of Waste in Machine Building	407
4. Inspection of production and registration of rejects	17
5. Removal and storage of rejects	18
6. Losses due to rejects	20
7. Analysis of rejects on the basis of production records	21
Ch. III. Elements of Mathematical Statistics and the Theory of Probability as Applied to Analysis of Rejects and Production Control	28
1. Elements of mathematical statistics and the theory of probability	28
2. Sampling method of control	40
3. Correlational analysis	57
4. Distribution curves	63
5. Use of mathematical statistics in production quality control	65

Card 3/5

Prevention and Analysis of Waste in Machine Building	407
Ch. IV. Analysis of Rejects by the Statistical Method	85
1. General trends in analysis of rejects	85
2. Use of frequency curves in analysis of causes of rejects	86
3. Determination of probability of rejects according to statistical distribution laws	88
	115
Ch. V. Current Production Control	
1. Quality control of supplier's materials, semi-finished and finished products	116
2. Production quality control in foundries	116
3. Statistical quality control in foundries	129
4. Basic measures for prevention of rejects in foundries	141
5. Quality control by means of mechanical devices in mechanical manufacturing shops	146
6. Quality control of finished products in assembly shops	157

Bentonites of Sarigyukh deposit in Armenia. M. S. Meratashvili, S. S. Filatov, and N. P. Tugushi (Inst. Mineral Deposits, Tbilisi). *Sotsial'chentiy Akad. Nauk Gruzin. S.S.R.*, 15, No. 7, 431-5 (1954) (in Russian). — A detailed study of these bentonites (I) has shown that they can be used not only in drilling but also in many other fields. Suspensions of I are stable, have high structural and thixotropic properties and a sp. gr. of 1.03-1.05. The  $\alpha_s$ , detd. by the immersion method, were  $\gamma'$  1.504,  $\alpha'$  1.490, and thermal analysis data indicate that I are composed mostly of clays of the montmorillonite group. By sedimentation analysis I in a 2% suspension, yields 8-15% of material with particle size  $\geq 60 \mu$ , 19-41% with particle size = 1.5-60  $\mu$ , and 50-75% with particle size  $\leq 1.5 \mu$ . The amt. of the latter material might be increased to 90% by using a small amt. of Na pyrophosphate peptizer. E. Barabash.

Gaitishvili, and P.G. Shengaryashvili.

PURPOSE: This book is intended for economic geologists and mineralogists.

COVERAGE: This collection of articles describes the nonmetallic mineral deposits of the Gruzinisty SSR and the extent to which they have been exploited. Individual articles discuss the importance of barite, dolomite, talc, andesite, and other minerals; discuss the importance of chemical industry, of barite, gumbrite, and bentonitic clays to the petroleum industry; and of marble, slate, and limestones to the construction industry. A map depicting the major nonmetallic mineral deposits is included with the work. No personalities are mentioned. References accompany each article.

TITLE: The D-12 Windmill (Vetrodvigatel' D-12)

PERIODICAL: Sovkhoznoye proiz-vo, 1956, Nr 9, pp 73-75

ABSTRACT: A short description of (1) "Fermer #2" windmill outfit and (2) a shaft well or a borehole with a piston-type NP-95 pump driven by the 14-hp D-12 windmill. The flour mill is driven by a belt via an automatic-clutch drum. A type "VL" winch with a type NP-95 piston pump is used for lifting water; they are supplied by the manufacturer along with the windmill. The winch also has a belt drive operating from a pulley of the lower reducing gear of the windmill. With an average annual wind velocity of 5 m/sec, the outfit can mill up to 2,000 t of fodder grain and lift up to 2,000 m<sup>3</sup> water per year from 60 m depth. One man is needed to operate the outfit. Two schemes of the outfit are presented.

TITLE: UDS-1 unit for diffusion bonding in a vacuum

SOURCE: Svarochnoye proizvodstvo, no. 6, 1965, 34-35

TOPIC TAGS: diffusion bonding, metal diffusion bonding, vacuum diffusion bonding  
unit, UDS-1 diffusion bonding unit

ABSTRACT: The Scientific Research and Design Institute for Testing Machines and

Equipment has developed a unit for diffusion bonding of parts up to 100 mm in diameter and up to 100 kg in weight. The unit is a heated unit develops a maximum pressure of 5 atm at the parts being bonded. The working temperature of 1200°C is obtained by an electrically controlled furnace. The air evacuation system includes a pump with a flow rate of 100 sec<sup>-1</sup>, a vacuum gauge with a vacuum of 10<sup>-2</sup> mm Hg, and a diffusion bonding chamber with a volume of 1000 cm<sup>3</sup>. The unit is used for diffusion bonding of various materials. The power is supplied by a 220 volt, 50 Hz current. The

bonding temperature depends on the kind of metals being bonded. Elastic elements made of 35GSA low-alloy steel were successfully bonded at 1050C under a pressure of 1.2 kg/mm<sup>2</sup>. Orig. art. has: 3 figures. 2
